

13.4.4, Problems B, C, D

**13.4.4** Determine the splitting field and its degree over  $\mathbb{Q}$  for  $x^6 - 4$ .

■

**B.** Let  $p$  be a prime number and  $F$  the field of integers mod  $p$ , and let  $p(x)$  and  $q(x)$  be any two irreducible polynomials of degree 2 over  $F$ . Show that the fields  $F[x]/(p(x))$  and  $F[y]/(q(y))$  are isomorphic by constructing an explicit isomorphism.

- (a) Show that if  $p = 2$ , then the statement is true (what are the irreducibles?), so you may as well assume for the remainder of the problem that  $p$  is not 2.
- (b) Show that if you construct a ring homomorphism  $\phi : F[x] \rightarrow F[y]$  so that the ideal  $(p(x))$  gets sent into the ideal  $(q(y))$ , then you will have a well-defined homomorphism  $\gamma$  on their quotients:

$$\gamma : F[x]/(p(x)) \rightarrow F[y]/(q(y)).$$

- (c) Since  $\{[1], [x]\}$  are a basis for  $F[x]/(p(x))$ , then it suffices to specify where 1 and  $x$  go under  $\phi$ . As a ring homomorphism,  $\phi(1) = 1$ . Now you'll need to set

$$\phi(x) = ax + b$$

for some  $a$  and  $b$ , but choose  $a$  and  $b$  such a way that  $\phi(p(x))$  is sent to a multiple of  $q(x)$ .

■

C. Find a real number  $u$  such that  $Q(\sqrt{3}, \sqrt{5}) = Q(u)$ .

■

**D.** Suppose  $K$  is an extension of  $F$ , and  $\phi : K \rightarrow K$  is an isomorphism that leaves every element of  $F$  fixed. Show that any polynomial in  $F[x]$  that has a root  $r$  in  $K$  also has  $\phi(r)$  as a root.

■
